

Requirement Analysis

Solution Requirements (Functional & Non-functional)

Date	28-06-2026
Project Name	Software Installation Request Automation
Team ID	
Maximum Marks	

Functional Requirements

These are the specific behaviors, features, and functions your ServiceNow system must perform based on your workflow design.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Service Catalog & Form Submission	Portal access to the "Software Installation Request" item.
		Auto-population of values, such as the Requested For field defaulting to the logged-in user, and pulling Department and Location dynamically from the user's profile.
		Dynamic form fields and UI Policies to enforce mandatory validations for Software Name, Version, and Business Justification.

FR-2	Backend Record Management	Automatic creation of mapped records in the Request (sc_request), Requested Item (sc_req_item), and Catalog Task (sc_task) tables upon submission.
		Status tracking and updating for task states (e.g., Open, Work in Progress, Completed).
		Execution of a Business Rule to automatically create an incident if a requested software license is unavailable.
FR-3	Automated Approval & Task Workflow	Dynamic automated approval routing to Managers or Security Officers for compliance and policy validation.
		System logic to prevent incomplete requests from proceeding.
		Automated generation and assignment of catalog tasks to the correct IT support/Software team.
FR-4	Automated Notifications	Triggering initial submission notifications to requesters.
		Triggering notifications for approval updates and final completion once the IT team installs the software.

Non-functional Requirements

These define the system's operational attributes—how well the system performs its functions. Since you are building on the ServiceNow platform, you inherit many of these automatically, but they must still be documented.

NFR No.	Non-Functional Requirement	Description
----------------	-----------------------------------	--------------------

NFR-1	Usability	The Service Portal interfaces must ensure a user-friendly experience that aligns with business needs, utilizing tooltips/help text and a clean layout to reduce confusion.
NFR-2	Security & Governance	The automation must enforce compliance, IT governance, and security policies, utilizing role-based approvals and controlled flow logic.
NFR-3	Reliability & Data Integrity	Mandatory validations must happen at both the client side (UI Policies) and server side (Business Rules) to maintain data reliability across REQ, RITM, and SCTASK tables and prevent unauthorized/incomplete requests.
NFR-4	Maintainability & Scalability	The solution must be designed to be easily maintained by admins or future developers by leveraging clear workflow documentation and update sets for configuration migration.
NFR-5	Performance	Client-side UI policies (such as dynamically displaying additional fields only when licensed software is selected) and auto-population scripts must execute seamlessly to keep the request form clean and fast.
