Maximum Marks	

Problem - Solution Fit Canvas

1. CUSTOMER SEGMENTS

- **End-users (employees):** Individuals who require company-approved software (e.g., Microsoft Office) installed on their devices to do their jobs.
- **IT Support/Fulfillment Team:** IT staff who need clean, organized, and complete request data to process installations.
- **Approvers:** Managers and Security Officers who validate requests for compliance and licensing.

2. JOBS-TO-BE-DONE / PROBLEMS

- Submit requests for software installations easily through a centralized service catalog.
- Get rapid, structured approvals for requested software from managers or security teams.
- Track the exact status of a submitted request transparently without guessing.

3. TRIGGERS

- An employee is assigned a task and realizes they lack the necessary software to perform their work.
- A new device needs to be provisioned with specific software versions.
- A requested software license is unavailable, which requires immediate incident creation.

4. EMOTIONS BEFORE / AFTER

- **Before:** Frustrated by delays, anxious about manual coordination errors, and overwhelmed by a lack of visibility.
- **After:** Relieved by faster software access, empowered by transparent tracking, and confident in the standardized IT service delivery.

5. AVAILABLE SOLUTIONS (Past/Alternatives)

- Sending manual, unstructured emails to the IT Helpdesk for software installations.
- Engaging in heavy manual coordination that delays request handling and pulls IT away from critical tasks.

6. CUSTOMER CONSTRAINTS

- **Knowledge:** Users often submit incomplete requests because they do not know what specific business justifications or version details are required.
- **Licensing Constraints:** Approvals are heavily dependent on IT governance, security policies, and available software licenses.

7. BEHAVIOUR

- Users submit incomplete requests through unstructured channels.
- Requesters spend time chasing down managers or IT for status updates because there is no centralized tracking.
- IT teams waste time dealing with manual coordination errors instead of fulfilling the requests.

8. CHANNELS of BEHAVIOUR

- **Online:** ServiceNow Service Portal (Catalog and Order Status pages), email notifications, and the "My Approvals" dashboard.
- **Offline:** The IT Support team physically or remotely installing the software on the employee's device.

9. PROBLEM ROOT CAUSE

- The absence of automated workflow routing; requests sit waiting for manual manager approval.
- Forms lacked mandatory validation (UI Policies/Business Rules), leading to poor data quality and incomplete requests.
- Zero visibility or automated communication regarding the request status.

10. YOUR SOLUTION

- A user-friendly, self-service catalog item in ServiceNow featuring dynamic variables (Software Name, Version, Justification, Urgency).
- An automated Workflow Editor design that instantly routes approvals and auto-assigns fulfillment tasks to the Software Support Team.
- Real-time email notification triggers (at submission, approval, and completion) to eliminate status-chasing.
